

Floor to wall overlap transition

updated 03/03/2025

An overlap transition from floor to wall is our preferred installation method and is utilized in most installations. It is completed by installing the flooring 6" – 8" up the wall, dependent on cove size and installing the Altro WhiteRock with a 2" overlap. The juncture is then finished with Altro sanitary sealant or tamper-resistant security sealant.

This installation technique is easier to install versus a heat-welded transition and offers enhanced security over water ingress. The overlap detail is an acceptable detail in most applications (showers, health care, veterinary, kitchens, and etc.).

Note: Altro W39 adhesive is the recommended choice for all WhiteRock installations across all BMH care levels.

*Tamper-resistant security sealant must be applied according to the manufacturer's instructions. For other installations, Altro sanitary sealant is suitable.
